Humanity's two greatest threats

1st: The climate crisis

Since the industrial revolution, humanity has put the earth's ecosystems under increasingly unsustainable pressures.

We are now beginning to experience clear & undeniable detrimental consequences: Extreme weather events, wildfires, flooding, habitat loss.

If we do not radically alter our course the earth faces certain catastrophe and ecological collapse rendering much of the world uninhabitable.

2nd: Artificial human enhancement

For over 150 years, groups around the world have been developing technologies that allow human beings to perform beyond their natural capability

We now live in a world amongst countless who have been unnaturally altered in ways which grant them increased strength, agility, and cognitive ability.

If allowed to continue without democratic oversight, use of these technologies will proliferate in the coming decades, transforming society in a way that few would want. There is one in particular, neural interface technology, which poses an *extreme* threat. In active use today and responsible for some of the greatest human rights violations we have ever known.

These two problems are linked in ways you might find unexpected.
